CavitySafe weephole protector stainless steel

- 1 The patented CavitySafe is a universal solution for a perfect protection of the cavity against all kind of vermin, with conservation of the needed cavity insulation. Furthermore it makes the cavity look nice and seamless. CavitySafe is easy to mount afterwards in weep holes from 5 to 25mm width.

Clean the weep hole before mounting the CavitySafe grill. Cut out, if necessary, excess joint- and cement grout deep enough, so there will be a nice space to fit the grill in.

- 2 Take the CavitySafe between your fingers.

If it is a very width weep hole you can add a thin layer of glue to the sides (for example a MS-polymer) for a perfect fixation.

Stint the ends of the CavitySafe together and push the grill in the weep hole.

- 3 Push the CavitySafe further in to the weep hole.

Depending on the width of the weep hole, the grill is light or more severe to mount. Use in case of very small weep holes a wooden cube and a hammer to carefully put the grill in the weep hole.

- 4 CavitySafe is mounted correctly when the front is equal with the cavity front. The grill is then firmly clamped in the cavity.

The result is a durable and nicer cavity, vermin are kept away and the ventilation is secured.
