

## VentiBrush protection brush

### Do you have problems with vermin or birds under roof tiles?

With the VentiBrush you protect the tiled roof against martens and birds, while the ventilation stays retained. The brush has to be fixed behind the first batten. The Ventibrush is available in two diameters, 100 and 200mm and the lengths pieces of one meter can simply be hooked together to cover a larger distance.

In combination with our Bladex gutter brushes or our VentiStrip eaves comb filler, you can provide an excellent barrier against martens and birds as a result of which they will seek another place to go to.

#### Feature

Colour : black  
Length : 1 meter  
Diameter: 100 mm, 200 mm

Building projects that are delayed by breeding birds are a nightmare for every contractor. By government legislation, nests, eggs and young birds are protected. During the whole breeding season it is not allowed to proceed with construction work near the nest.

It is allowed to take precautionary actions. For example by blocking the access of the breeding spots. The Venti-Brush is an affordable solution. Place the large round brushes in the gutter or under the roof tiles to prevent birds from nesting. By means of the little hooks at the end of the brush, the lengths can easily be connected to each other and will not be blown out of the gutter.
