# NetNox ventilating stainless steel net

**Flexible and universally applicable for cracks and crevices.  
Pest repellent yet ventilated seal.**

Many cracks and crevices in construction also function as ventilation facilities. Ventilation is often important for the preservation of the structure. Unfortunately, these cracks and crevices provide excellent hiding or nesting opportunities for unwanted small visitors. With NetNox stainless steel sealing net, the vermin remain outside and ventilation is maintained.

NetNox is suitable for the ventilated sealing of holes and crevices in roof tiles, ridge tiles, fascias, facade cladding, duct and pipe penetrations. Also excellent for use in an open cavity under roof connections or for flexibly closing open expansion joints in facades.

- high quality material, stainless steel-316
- durable and weather resistant
- keeping out bats, mice, rats, martens and birds
- flexible material to process
- easy to cut to size
- to model to the correct shape
- standard width 5 and 15cm

The material is extremely durable and weather resistant. The fine wire structure makes it easy to process. It can be folded and rolled smoothly into all kinds of shapes. NetNox is also easy to cut to size with scissors. Folding, cutting, making rolls; all possible!

In order to determine how much NetNox is required and how it should be folded and sized, choosing the mounting method is also important. Depending on the surface, accessibility and the degree of visible work, it can be mounted with sealant, nails or screws. Tensioning with slats is also possible or simply pressing something between them is sufficient.

Many possibilities, especially with the addition of your own creativity!
